General BioChemicals
Div. Mogul Corp.
Chagrin Falls
Permit No. 1185

Expires 5-1-70

Contact: Herbert H. Davidson Plt. Mgr.
George Smoleny Chief Chemist

Products: Water treatment chemicals, and a
variety of organic and inorganic
research chemicals and food supplements
for animals.

Raw Materials: Phenols, Ether, Casein, Chromates, etc.

The plants produce products that are very high priced and so great care is taken so that there are no spills or wastes allowed to be dumped. All of the operations are of the small batch type which makes losses unusual.

There are three septic systems serving the plants. Two of these pass thru three settling tanks and into a sand filter and into a storm ditch which leads to the Chagrin River. The analyses of this effluent is reported to the State and it appears to be in good shape. The effluent from the third septic system flows into another small creek and into the Chagrin River. This flow is not sampled or analyzed. However the effluent appeared to be good.

It is recommended that this company report the analyses for both effluents that eventually end up int the Chagrin river.
